The SADC Harmonized Seed Regulatory System (HSRS) creates a market opportunity for varieties registered under the system.

Register seed varieties on the SADC Seed Variety Catalogue to access regional market.

The purpose of the SADC HSRS is to integrate the smaller and isolated national seed markets into one larger SADC seed market, resulting into the promotion of entry of new and cheaper improved varieties in the region as well as ease the movement of high quality and certified seed from countries with surplus to countries in deficit.

The regional market is limited to varieties registered in the SADC Seed Variety Catalogue since they will have been tested and released according to the regional variety release system. For a variety to be registered on the Regional Seed Variety Catalogue, it must have been released in at least two SADC Member States. Malawi has large volumes of released varieties of different crops which could be eligible for regional registration. So far, over 10 maize varieties, mainly those of multinational seed companies, have been registered on the Regional Catalogue, but hundreds of other crop varieties are available. This creates a great market opportunity for the seed industry in Malawi to gain access to a larger regional market. As such, the seed industry is encouraged to register seed varieties on the SADC Seed Variety Catalogue. Application for regional registration must be accompanied by;

1. Results of Distinctiveness, Uniformity and Stability (DUS) and Value for Cultivation and Use (VCU) tests
2. The suggested variety name and variety identification number
3. Proof of national release in two countries
4. Reference sample

Selected crop varieties with their description, recommended agro-ecological conditions for production, year of release and variety maintainer are listed in this leaflet. These crops have their seed certification and quality control standards harmonized in the SADC region.

Table 1. Selected crop varieties with their description, recommended agro-ecological conditions, year of release and variety maintainer released between 2009 and 2018

| 3  | MH 30 (CZH0713) | • White semi-flint  
• Tolerant to low N  
• Tolerant to moisture stress  
• Matures in 140 days  
• Tolerant to GLS, leaf blight and rust  
• Yield up to 8000Kgs/ha | Mid altitude and lowland | 2013 | DARS/CIMMYT |
| 4  | MH 38 (MAO 9041) | • Semi-flint grain with good poundability  
• Medium maturity in 120 to 130 days  
• Tolerant to GLS, maize streak mosaic virus (MSV), common rust and northern leaf blight (NLB)  
• Yield up to 10000Kgs/ha. | Mid altitude and lowland | 2013 | DARS |
| 5  | MRI 614 | • White Semi-flint maize hybrid  
• Medium duration: takes 130-135 days to mature  
• Resistant to cob-rot.  
• Good standability  
• Yield potential of 10 tons/ha  
• Tolerant to GLS and NLB (chiwawu) | Well adapted to drought prone marginal areas, Drought tolerant Well adapted to a wide range of agro ecologies | 2014 | Syngenta |
| 6  | Peacock 10 (Czh04007) | • Semi-flint white quality grain which is poundable  
• Medium maturity hybrids; take about 135-140 days to mature  
• Drought Tolerant  
• Good tolerance to major leaf diseases  
• Good tolerance to GLS, rust and NLB  
• Stable yields up to 8 ton/ha or more. | Mid altitude | 2014 | Peacock/CIMMYT |
| 7  | P3812W | • Matures in 120 days  
• Excellent grain quality  
• Tolerance to GLS, MSV, Common rust and NLB  
• Tolerance to stem and root logging  
• Potential yields of 7 tons/ha | Mid altitude areas | 2014 | Pioneer |
| 8  | SC423 (10C3260), Kanyani | • Early maturing variety  
• Tolerant to diseases, especially MSV  
• Relatively high yielder with potential of 10 tons/ha | Well suited for Dimba cropping | 2016 | SeedCO |
| 9  | PAN 4M-23 (PEX 405) | • White flint maize hybrid  
• Matures 115-120 days  
• Two big and equal size cobs per stalk  
• Resistant to NLB, GLS, rust, MSV, and cob rots  
• Yield potential of 10tons/ha | Drought or prolonged dry-spell conditions | 2017 | Pannar |
| 10 | DK 777 | • A flint medium maturing hybrid  
• Matures early 120-135 days | Mid altitude areas | 2017 | Monsanto |

| 11 | MH46A        | • Pro vitamin A hybrid  
• Poundable with flint kernel texture  
• Average plant height of 142 cm and an ear height of 63cm  
• Matures in 128 days  
• Tolerant to GLS, MSV, rust *Puccinia* spp and leaf blight *Exserohilum turcicum*  
• Vitamin A level of 6.5 µg/g - Carotene colour intensity score of 1.8  
• Average yield of 4.5-10.6t/ha | Mid altitude and lowland areas | 2018 | DARS |
| 12 | MH48A        | • Poundable with flint kernel texture  
• Pro vitamin A hybrid  
• Average plant height of 146cm and an ear height of 67 cm  
• Matures in 130 days  
• Tolerant to GLS, MSV, rust *Puccinia* spp and leaf blight *Exserohilum turcicum*  
• Vitamin A level of 5.6 µg/g - Carotene colour intensity score of 2.4.  
• Average yield of 4.3-7.7t/ha | Mid altitude and lowland | 2018 | DARS |

| 15 | Tikolore (TGx 1740-2F) | • Early maturing ~ 85-100 days depending on altitude  
• Moderately tolerant to a wide range of leaf diseases  
• Moderately tolerant to shattering  
• Promiscuous/seed nodulating  
• Good uniformity and standability  
• Average yield range of 1.5 to 2.5 tons/ha | • Adapted to a wide range of agro ecologies | 2010 | DARS/IITA |
| 16 | SC Serenade | • Yellow seed color  
• Long pod shutter free period  
• Tolerant to diseases  
• Yields 3000 kg/ha. | High and mid altitude areas | 2012 | SeedCo |
| 17 | NUA 35 | • Early maturing sugar beans  
• Matures in 55-60 days  
• Produces large and dense seed grains  
• High tolerance to bean common mosaic virus (BCMV), bean rust and angular leaf spot (ALS)  
• Yield potential of 2tons/ha | • Widely adapted to major bean growing areas of Malawi | 2017 | DARS |
| 18 | VTTT 924/10-4 | • Early maturing sugar beans  
• Matures in 61-70 days  
• Produces large and dense seed grains  
• High tolerance to BCMV, bean rust and ALS  
• Yield potential of 3tons/ha | • Widely adapted to major bean growing areas of Malawi | 2017 | DARS |
| 19 | CG 8 (ICGV-SM 08501) | • Virginia type  
• Very resistant to rosette  
• 120-130 days to mature  
• Pod constriction - deep  
• Red Seed colour  
• 71% shelling percentage  
• Yield ≥2500kg/ha | • Mid altitude | 2014 | ICRISAT/DA RS |

| 20 | CG 14 (ICGV-SM 99556) | • Spanish  
• Moderately resistant to rosette  
• 100-110 days to mature  
• Very pale tan seed colour  
• Pod constriction - none  
• 74% shelling percentage  
• Yield ≥2000kg/ha | Low altitude | 2014 | ICRISAT/DA RS |
| 21 | Mwayi Wathu Alimi (ICEAP 00557) | • Medium duration maturity  
• Open flower color is yellow with dense streaks  
• Flowers and matures 112-152 and 159-182 days respectively  
• 7-10 seeds per pod  
• Resistant to *Fusarium* wilt and soil borne diseases  
• Yield 2 to 3.5 tons/ha | Mid-altitude | 2009 | ICRISAT/DA RS |
| 22 | CC13 | • Dwarf with short internodes  
• Early maturing  
• Light green leaves and stem colour  
• Angular leaf venation pattern with oblong leaf shape and acuminate leaf tip  
• Smooth leaf surface at maturity  
• Topped at 18 leaves  
• Nematode and *Alternaria* brown spot resistance  
• Yield potential of up to 3000kg/ha | Adapted to all tobacco growing areas of Malawi | 2011 | ARET |
| 23 | PVH2259 | • Green leaves and stems when growing  
• Medium maturity  
• Angular leaf venation pattern with oblong leaf shape and acuminate leaf tip  
• Smooth leaf surface at maturity  
• Topped at 18-20 leaves  
• Nematode and *Alternaria* brown spot resistance  
• Yield potential of up to 3000kg/ha | Adapted to all tobacco growing areas of Malawi | 2011 | ARET |

| 24 | Mahyco C579, C608, and C570 | - Cotton hybrids  
- Relatively large ball size than existing varieties  
- High yielding | - Widely adapted to major cotton growing areas of Malawi | 2018 | Quton |

**Entering the SADC Seed Market**

There are procedures to be followed for a variety to be traded in all SADC Member States.

The variety must be released in at least two Member States. The holder of the variety must apply for regional release through National Seed Authority, providing proof of release in two Member States and valid data of Value for Cultivation and Use (VCU), Distinctiveness, Uniformity and Stability (DUS) of the variety and its suggested trading variety name. The variety holder will also provide the reference sample of the variety. Should a variety meet all the requirements for regional release, it will be entered in the SADC Seed Variety Catalogue and can subsequently be marketed in all SADC Member States. The holder will be required to pay a fee for a variety to be maintained in the SADC Seed Variety Catalogue.

**SADC HSR Market-Related Opportunities**

- The seed variety release process in almost all SADC Member States is similar and takes not less than 3 years. The HSRs will shorten the period, as once a variety is released in two SADC Member States and entered in the SADC Seed Variety Catalogue, it will automatically be release and can be traded in all Member States. Reduction in the length of time entails reduction in the cost of releasing a variety. This will be beneficial to seed suppliers in the region.
- With the HSRs, seed markets will be broadened as suppliers will be able to trade in all SADC Member States, making it easier to access the once fragmented seed market.
- The HSRS will bring a more competitive seed market, as both national and multinational seed suppliers will be subjected to the same environments, opposed to the current situation where it is difficult for emerging seed companies to release their varieties in multiple countries.
- Suppliers may benefit from reduced costs of seed production, as some countries may act as production base for certain crops due to favourable climatic factors.
- The HSRS comes with common quality assurance mechanisms, improving the level of confidence as seed moves from country of production to where it will be marketed, reducing supplier quality concerns.
The HSR will facilitate safer, faster and legitimate seed trade, having harmonized all import and export procedures and documentation, resulting in reduced seed supplier’s transaction costs.

Since all seed suppliers in the region will be subjected to the same regulations, there will be a coherent industry voice regarding the need to improve certain policies as situations arise affecting seed trade in the region.

It is also expected that agro-dealer enterprises will boom especially in rural farming areas, to improve access to seed by smallholder farmers, providing employment, notably for the youth.

For more information on the registration of seed varieties on the SADC Seed Variety Catalogue, visit the website of the SADC Seed Centre
